Introduction

Reliable, high-quality public statistics are essential to the implementation of an evidence-based socio-economic policy.

Statbel¹, the Belgian statistical office, is the main producer of public statistics in Belgium and a major supplier of data to other federal, regional and international statistics producers. In addition, it is a key player for the research community, which expects reliable and accessible data.

In today's society, where what is presented as "reality" increasingly needs to be examined, contextualized or linked to verifiable data, public statistics are in a key position. Indeed, they are produced by public authorities, in a national and international, regulatory and methodological framework, and according to a number of fundamental principles such as the guarantee of professional independence, objectivity and scientific character, data protection, quality, comparability of figures, free access for all, as well as public confidence through clear communication of methods and results.

In addition, the ability to contextualize national data within a European framework is becoming increasingly important. The Belgian Presidency of the Council of the European Union, in the first half of 2024, will highlight this dimension, and Statbel's figures should provide a better understanding of Belgium's place within Europe.

As National Statistical Institute and Belgium's first contact point for Eurostat, Statbel will naturally have a role to play during this Presidency. As such, Statbel will have to ensure that progress is made on the priorities and regulatory initiatives on the table of the Council Working Party on Statistics of the Council of the European Union, which it will chair.

In this same European context, Statbel will have to take into account the recommendations arising from Eurostat's last Peer Review, which took place in Belgium in December 2021, with a view to the annual reporting on their implementation by the Member States to the European Commission, which will begin in January 2024.

In 2024, the first results of the "Census 2021" (formerly the General Population Census) will be published. These will provide detailed figures on demography, socio-economic aspects, education and housing of the Belgian population.

Statbel also provides other statistics needed to support the federal government's socio-economic priorities. These include statistics on wages, labour costs, training, the labour market, poverty, demography, the ICT use by households and enterprises, the environment and agriculture, road accidents, housing, the real estate market, the calculation of the consumer price index, and so on.

The ultimate aim of statistics production is to make them available to users. This is usually done on a bespoke basis, using all possible forms of communication, in the most appropriate and up-to-date way possible.

Ongoing dialogue with all users and stakeholders is essential to consolidate Statbel's customer focus.

This will enable needs and problems to be identified and taken into account throughout the process of producing public statistics. These may include requests for additional figures in certain

¹ Directorate-General Statistics – Statistics Belgium of the FPS Economy, SMEs, Self-employed and Energy

emerging areas, problems or resistance to responding to statistical surveys or providing data, or insufficient access to detailed data.

Statbel will therefore continue to pay close attention to these various aspects and will implement ad hoc actions to support this enhanced customer focus.

1 Mission & objectives

1.1 Mission statement

The mission of Statbel consists of **collecting**, **producing** and **disseminating** reliable and relevant figures on the Belgian economy, society and territory.

Where possible, data collection is based on administrative data and registers and on other private data (scanner data, web scraping, big data, etc.). These sources are not always of sufficient quality, comprehensive or available on time to be used as the sole source of data. The additional surveys among citizens and enterprises are carried out by means of a modern and flexible 'mixed mode' data collection, in which the data available in the administrative databases are pre-filled.

Statbel produces around 100 statistics, the majority of which (75%) meet European obligations. Other statistics are produced in the framework of legal obligations related to the National Accounts Institute (NAI) or in support of the federal socioeconomic policy. About 60% of the statistics are compiled from administrative databases or other existing sources; for the remaining 40%, surveys are used for all or part of them.

Data processing is carried out using an integrated data warehouse, suitable data processing software, our own business data registers (DBRIS), demographic data registers (DEMOBEL) and CENSUS. This ensures full quality control and compliance with data protection and statistical confidentiality.

Communication and dissemination of statistics is done with attention to various types of users, via different channels. The central channel is the website '**statbel.fgov.be**', where the focus is on user-friendliness and tools for specific target groups (e.g. municipalities, teachers and students, professional users, scientific analyses, an innovative DataLab, ...). The website gives access to the 'be.STAT' database, where customised tables can be created, and to the open data portal, where new data sets are regularly made available. Statbel is also responsible for the organisation of the European Statistics Competition in Belgium (in collaboration with our regional and community partners). This competition is intended for the third degree of secondary education. Finally, Statbel is expanding its presence on current social media.

In line with the ambition expressed in the Federal Government Agreement to optimise the availability of and access to data for scientific research, Statbel offers researchers the possibility to request detailed data sets, in compliance with national and European regulations on data protection and statistical confidentiality.

1.2 Vision

Statbel intends to become the hub of the Belgian statistical landscape, providing relevant and reliable figures to support European and Belgian socioeconomic policy.

In this respect, Statbel wants to be a pioneer in the modernisation of work processes, corporate culture, customer-friendliness and the efficient use of people and resources.

1.3 Objectives

Statbel has the following objectives:

- To disseminate relevant statistics and figures to support socioeconomic policy.
- To continue to modernise the statistical process through the use of new data sources, the reduction of response burden and administrative simplification.

Statbel must remain relevant in the new data landscape. The societal importance of high quality and objective public statistics and data must continue to be demonstrated. In particular, the following challenges need to be addressed:

- To continuously monitor new socio-economic trends and respond to requests for corresponding data on the impact of the crises that our societies are facing, on globalization, demographic change, new forms of work, digitalization, the collaborative economy, the circular economy, social inequalities and sustainable development (SDG's), the environment or new statistical demands arising from the European green deal and climate shocks.
- To use a range of modern communication channels to provide tailor-made statistics and data for different users, to raise awareness of Statbel and to increase users' statistical literacy.
- To play a central role in the public sector digital strategy through our expertise in data processing, our knowledge of available public data and the use of quality standards.
- To strengthen partnerships with the academic world, research organisations and public authorities in the fields of data processing and service provision, in order to support scientific research and political decision-making.
- To attract, retain and train staff with appropriate skills.
- To keep the focus on administrative simplification and reducing the response burden, without compromising the quality of the statistics produced.
- As a modern public body, to continue to invest in the use of new techniques and data sources, such as big data, smart data, web scraping, scanner data, artificial intelligence and innovative survey techniques, in order to continue to reduce the response burden and to be able to respond to new demands for statistics.
- To ensure easy access to administrative databases and data from private actors for statistical purposes through policy makers.
- To further optimise Statbel's coordination role as a federal statistical authority and Belgian NSI in the European context, and to develop a constructive cooperation with regional statistical authorities.

2 Context and working environment

Statbel has to take into account various contextual factors and the interests of many users and stakeholders.

2.1 European context

The major part of the statistical production is governed by European regulations:

- Regulation No 223/2009 on European statistics amended by Regulation No 2015/759;
- Regulation No 557/2013 implementing Regulation No 223/2009 as regards access to confidential data for scientific purposes;
- Regulations specific to each statistic;
- The European Statistics Code of Practice adopted by the European Statistical System Committee on 16 November 2017;
- Statbel is the National Statistical Institute for Belgium within the meaning of Regulation No 223/2009. As such, it is 'the body having the responsibility for coordinating all activities at national level for the development, production and dissemination of European statistics (...) and shall act as the contact point for the Commission (Eurostat) on statistical matters. The coordinating responsibility of the NSI shall cover all other national authorities responsible for the development, production and dissemination of European statistics (...). The NSI shall, in particular, be responsible at the national level for coordinating statistical programming and reporting, quality monitoring, methodology, data transmission and communication on ESS statistical actions.' (Article 5).

In addition, in accordance with the obligations contained in Regulation No 2016/679 on the protection of natural persons with regard to the processing of personal data and on the free movement of such data (General Data Protection Regulation, hereafter 'GDPR'), Statbel has established a series of procedures to ensure confidentiality and data protection. Statbel has also appointed a data protection officer who ensures compliance of the data processing.

2.2 Belgian context

At Belgian level, Statbel is subject to the obligations of the Law of 4 July 1962 on public statistics. This law sets out the general framework of Belgian public statistics and governs procedures such as the communication of microdata. This is a crucial task, as it positions Statbel as a major partner of scientific research in Belgium.

Furthermore, Statbel, as member of the National Accounts Institute (NAI), plays an essential role in data collection.

In 2014, a cooperation agreement was concluded between the Federal State and the Regions/Communities in order to strengthen the collaboration between these entities in the field of public statistics. The Interfederal Statistical Institute (IIS) started its activities in January 2016. In concrete terms, the collaboration between the various partners of the IIS is reflected in the establishment of an annual integrated statistical programme. This programme includes the agreements concerning the public statistics to be drawn up collectively or the actions that should make it possible to increase the quality of the statistics and reduce the overall response burden.

Statbel must also respect the administrative simplification objectives established by the law of 5 May 2014 ('Only Once' law).

Finally, Statbel ensures the confidentiality of the data it receives and can act as an intermediary organisation for further processing for statistical purposes, in accordance with the Royal Decree of 13 June 2014.

2.3 Budgetary context

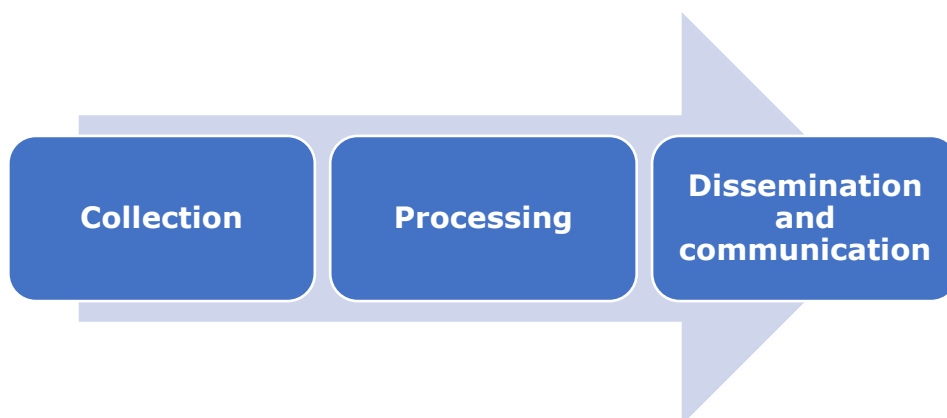

In 2024, Statbel's total budget amounted to 26.4 million euros, including 23 million euros (87%) in staff appropriations.

2.4 Staff

On 1 December 2023, Statbel had 294 employees, 52% of them were highly-skilled staff (A and B levels). This share has increased in recent years. In addition to this staff, 200 freelance interviewers carry out surveys among citizens.

3 Organisation of statistical production

Statbel's statistical production is organised according to the following sequence:

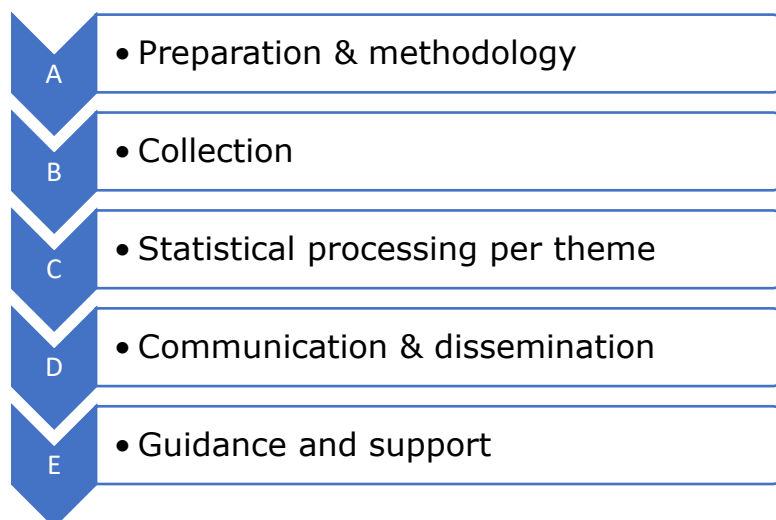

where each of these three main steps is carried out by a specialised service. This makes it possible to pool and continue to professionalise collection, processing and communication tools. Methodology is also dealt with in a transversal manner.

The GSBPM – *Generic statistical business process model* – developed by the UN and endorsed by Eurostat provides for the following steps in the statistical production process:

In keeping with the GSBPM model, Statbel's programme is organised and presented as follows:

In addition to this classic mode of production, Statbel also develops innovative methods for the production of statistics. This is done by using new data sources or new methods, or by cross-checking various data sources. As these results are not always considered as recurrent official statistics, they are published as experimental statistics, in beta version, in the 'Statbel DataLab' section.

4 Preparation & methodology

4.1 Introduction

Beyond its recurrent work of methodological support to Statbel's statistical production, the methodology department focuses on administrative simplification, a.o. through a model-based approach and the increased use of administrative data.

4.2 Developments: ongoing and new projects

From 2024 onwards, the Methodology department will participate in the revision of the Household Budget Survey (**HBS**), in particular the revision of the sample design and extrapolation methods.

The latest developments necessary for the revision of the Labour Force Survey (**LFS**) will be pursued: aligning the calibration models with the estimation of monthly indicators and applying time series analysis in the estimation of monthly indicators.

For the National Register of Natural persons (**NRNP**): the methodology department will continue to improve the creation of sampling and calibration frames. The information included in the sampling frames will be reduced while taking into account confidentiality rules. The efficiency of the process will be improved: more efficient SAS code, elimination of redundancy, minimisation of storage space, reproducibility.

The methodology department also continues to prepare, in 2024 and in collaboration with other departments, the implementation of **EBS** (Regulation 2019/2152). The methodologists will study the consequences of applying the definition of the statistical unit 'enterprise' on sampling.

The methodology department is actively involved in the implementation of the revised classification '**NACE rev2.1**' in the business register and in the various statistics.

In addition, the methodology department makes its expertise in the field of sampling and extrapolation of surveys available to Statbel's other partner institutions (e.g. Sciensano).

Because of the risk of discontinuity in the INSEE (French National Statistical Institute) support for the use of the **CALMAR** and **POULPE** macros, the Methodology department will study the possibility of using alternative codes (developed in R) for the calibration and variance estimation of the various Statbel surveys.

5 Data collection

5.1 Introduction

The data necessary to produce statistics are increasingly collected by using administrative registers, via web scraping and the use of big data. Furthermore, Statbel carries out surveys among **citizens** and **enterprises**.

5.2 Recurring work

5.2.1 Surveys among enterprises

About twenty surveys are organised each year among enterprises, related to various topics such as production, transport, wages, job vacancies, ICT use, prices, agriculture and business structure. The surveys are completed online.

5.2.2 Surveys among citizens

In 2023, Statbel will organise five surveys among citizens. These are:

- the Labour Force Survey (LFS),
- the survey on ICT usage in households (ICT households),
- the Household Budget Survey (HBS),
- the survey on income and living conditions (EU-SILC),
- the survey on travels.

The interview is conducted face to face with the help of interviewers or online in combination with telephone or postal follow-up.

5.2.3 Enterprise databases

The Database - Enterprises department establishes the register of statistical units (local units, enterprises and enterprise groups and economic activity units) and participates in the construction of the European register of business groups (**EGR**).

The activities of the department are based on several axes:

- Support activities: construction of universes for surveys, answers to ad hoc questions based on the use of the register of statistical units, supply of individual data extracted from the register;
- Management of the statistical units of the register, monitoring of administrative data flows, participation in the effort to build the European business group register, analysis of the structure of large business groups (profiling);
- Work on improving the quality of register data, e.g. management of manual checks on the economic activity code (NACE), addresses and websites of companies.

5.2.4 Citizen databases

The Database - Citizens department acquires and integrates administrative databases useful for the compilation of statistics on households and individuals.

5.3 Developments: ongoing and new projects

5.3.1 Surveys among enterprises

The work of the department 'Surveys - Enterprises' is based on the following principles:

- **Only once**

Since 2014, the 'only once' principle has been enshrined in law. This principle means that public authorities cannot ask twice for the same information.

- **Administrative simplification**

Through continuous screening of all surveys, Statbel ensures that the administrative burden is kept as low as possible. To this end, various techniques are used, such as limiting the sample size, reducing the frequency of surveys, raising the thresholds for participation in surveys, pre-filling questionnaires with data from other sources, cleaning questionnaires to delete questions that are not essential and trying to limit, as far as possible, the data collection to information that is strictly necessary to comply with European and/or national obligations (gold-plating).

Following the analysis launched in 2023 concerning the calculation of short-term indicators for manufacturing and construction, two new shortened monthly questionnaires, replacing the monthly PRODCOM survey, will be launched in 2024. The PRODCOM survey will be limited to one annual questionnaire, which means a significant reduction in the administrative burden for enterprises. In 2024, the question of whether VAT figures can be used, for certain groups of enterprises, to replace the monthly surveys will be further examined.

At the same time, Statbel pays a lot of attention to the way in which the information can be provided by the respondents. In addition to the use of user-friendly online surveys, for a number of surveys it is also possible to upload or copy data directly from the computer programs used by enterprises.

Statbel also continues to focus on digital communication with enterprises. The use of the e-box for annual surveys among enterprises is now widespread.

5.3.2 Surveys among citizens

During 2024, Statbel will continue to make its expertise available to Sciensano for the Health Interview Survey.

5.3.3 Enterprise databases

The content of the business register is adapted within the framework of the European project **EGR** (EuroGroups Register). This project was started to improve the exchange of business group data with Eurostat, other NSIs and central banks. Data are exchanged with Eurostat in SDMX format. The control work on some business groups will be continued.

The '**profiling**' project analyses the large business groups that are active in Belgium. Profiling is a method of analysing the structure of groups to establish the statistical units 'enterprises' within them. Some of this work is carried out in the framework of an international collaboration coordinated by Eurostat. The profiling data are also used in the LCU (Large Case Units) project. This aims to improve, for a list of large business groups, the consistency of certain key variables produced by our different statistics.

Work will be carried out to adapt the business register in preparation for the revised NACE nomenclature coming into force on 1 January 2025.

5.3.4 Citizen databases

The results of the **Census 2021** will be published. As with the previous Census, these results are based solely on administrative data. For this Census 2021, new data sources have been used to improve the quality of the results. The possibility of a continuous Census will be examined, but will remain highly dependent on access to administrative sources.

6 Economic statistics

6.1 Introduction

6.1.1 Economic statistics

Statbel compiles economic statistics on topics such as prices, economic indicators, the labour market, the real estate sector, the tourism sector and agriculture. Statistics are produced based on information from surveys among enterprises, administrative databases and big data (web scraping and scanner data).

Constant efforts to modernise are undertaken through the increased use of administrative databases, new data sources and new techniques, while always taking into account the maintenance of quality.

6.1.2 Enterprise databases

The department provides monthly and annual statistics on VAT registered units.

6.2 Recurring work

6.2.1 Economic statistics

Several indicators are calculated each month, in order to show the evolution of consumer prices over time:

- the **consumer price index (CPI)**, as well as the health index and the smoothed index, which are derived indices, for national purposes;
- the **harmonised index of consumer prices (HICP)**, which allows, among others, a proper comparison of the inflation rates of EU Member States, as well as indicators derived from it, such as the harmonised index of consumer prices at constant tax rates (**HICP-CT**);
- the **HICP flash estimate**, which is first published in the consumer price index press release and then by Eurostat.

Statbel also carries out the secretariat of the Index Commission and implements the annual work programmes drawn up each year by this commission.

The premiums for non-work-related health insurance contracts may be adjusted on the annual premium due date, either on the basis of the consumer price index or on the basis of a specific index. These specific indices, known as '**medical indices**', are calculated once a year for the covers 'private room', 'double and multiple room', 'ambulatory care' and 'dental care'. There is one overall index and one for five age groups. These indices have been published on the first working day of July since 1 July 2016 (basis: 2015=100).

In addition, as part of its European obligations, Statbel collects data for establishing **purchasing power parities**, which allow comparisons of purchasing power between countries. The data collected are sent to Eurostat, which calculates the statistic and publishes the results.

In the field of producer prices, price indices are also calculated as part of the European obligations on short-term indicators: the **producer price index** in manufacturing, construction and the service sector.

The **short-term indicators** also include the following statistics for manufacturing, construction and services: **production, turnover** and **investments**. Several business statistics on the labour market are also produced in the form of quarterly indicators: **employees and persons employed, wages and salaries, hours worked** and **labour costs**. Short-term statistics, produced either on a monthly or quarterly basis, provide an indication of the economic development of the sectors. Finally, Statbel publishes short-term indicators on the number of **bankruptcies, tourist arrivals and overnight stays**, and the **job vacancy rate** in Belgian enterprises.

In addition to this, Statbel calculates a series of annual or multiannual statistics. The results of the **Structural Business** Survey make it possible to monitor structural developments in the

economy. The extent to which enterprises make use of computer applications is measured via the **ICT usage by enterprises**.

The annual **structure of earnings** statistic measures the effect of individual and employer characteristics on earnings. Based on this statistic, it is possible to monitor the evolution of the **gender pay gap**.

The new three-yearly statistics on **global value chains** highlight all the cross-border activities that take place to bring a good or service from the production stage to the end consumer. The four-yearly **labour cost** statistics provide the total labour cost for employers, while the five-yearly statistics on **continuing vocational training** provide a picture of the efforts made by enterprises to train their staff.

In terms of **real estate indicators**, Statbel compiles detailed statistics on the price level, as well as on price developments (house price index), building permits, the building stock and land use.

In addition, a whole series of **agricultural figures** are produced on agricultural and horticultural holdings, **macro-economic accounts for agriculture**, **agricultural prices**, **dairy statistics**, **animal slaughterings**, ...

6.2.2 Enterprise databases

The annual **number of VAT-registered units** is available 10 months after the reference period. Annual statistics on regional migrations and survivals of active VAT-registered units are also published.

Monthly results on VAT registrations, first registrations (start-up) and de-registrations are also available by economic activity code.

The department is also responsible for the construction of business statistical units, from which **business statistics** are compiled. Enterprises are constructed from the legal units for which an economic activity has been detected at least one day during the year on the basis of administrative files (NSSO, VAT, annual accounts, etc.). Active enterprises usually correspond to a single legal unit, but in some cases it is necessary to group them together to meet the European definition.

6.3 Developments: ongoing and new projects

6.3.1 Economic statistics

Consumer price index

The consumer price index has been a chain index since 2014. This allows annual adjustments to be made to the basket and the calculation method. In this way, inflation can be measured as accurately as possible over time. The Index Commission (a commission made up equally of representatives of the academic world and of employers and workers) draws up an update of the work programme for this purpose every year in consultation with the administration. At the end of the working year, the Minister of Economy receives an opinion setting out the proposed adjustments, the points for attention and the progress of the work programme. The next adaptation of the work programme will take place in February 2024.

Thanks to the annual work programme, the methodology and techniques, both in terms of price collection and calculation, remain accurate over time. This way, the representativeness of the

For the HICP, Statbel plays an active role in Eurostat working groups and is closely involved in the development of new recommendations at European level for the calculation of this index.

Preparations for the implementation of the new consumption expenditure nomenclature "COICOP 2018" are underway. The "COICOP 2018" will replace the "ECOICOP/COICOP 1999" nomenclature from 2026 onwards. This nomenclature will be introduced simultaneously into the HICP and CPI. For both statistics, around 20 years of back data will be available in the new nomenclature. The necessary calculations will be carried out in the coming years.

In addition, the coverage of the HICP will also be extended to include gambling from 2026. The necessary data will therefore also be collected. A methodology will be developed to correctly capture this segment.

In addition, a number of other web scraping projects are underway for gradual implementation over the next few years. Efforts will also be made to improve the methodology for the "electricity" and "natural gas" headings, also taking into account old contracts that are still active. The modernisation of data sources and methodologies will continue in the coming years (e.g. for the platform economy sector, such as Airbnb).

Agricultural statistics

A programme to modernise agricultural statistics is currently underway at European level.

Since 2020, the agricultural surveys have been carried out under the new **IFS** (Integrated Farm Statistics) regulation, for which a basic questionnaire and additional modules are to be used. The statistics, which are compiled from administrative data in combination with surveys, form the reference for monitoring developments in agriculture at both national and European level. They are therefore used by several actors in the agricultural sector and also to evaluate the European Union's common agricultural policy.

In the general agricultural survey, data are requested on labour force, agricultural diversification, mode of farming, livestock, animal housing and manure management. The questionnaire only covers information that cannot be obtained through administrative sources.

The work on the new framework regulation on Statistics on Agricultural Input and Output (SAIO) aims to harmonise agricultural statistics, which contain more than 50 different data sets and have undergone many changes since their creation in the 1950s. It also aims to ensure consistency between the different fields.

Business statistics

From 2021, the first deliveries of data meeting the requirements of the **EBS** Regulation took place. These are reforms imposed by the European Commission which imply new and sometimes shorter deadlines and new indicators to be developed (mainly in the trade and services sector), the use of KAUs (kind of activity units) to classify enterprises and to improve the homogeneity of the statistical surveys on economic activity and the switch to the reference year 2021=100 in 2024.

In addition, we will study the possibility of optimising the production of industrial indices by exploring the use of VAT figures.

In the context of tourist arrivals and overnight stays, Statbel will study, in collaboration with Eurostat, how to integrate the data of four platform companies active in residential tourism.

Commercial real estate

In 2019, the European Systemic Risk Board expressed the wish to have indicators on commercial real estate. Eurostat has launched a legislative initiative in response.

Statbel plays an active role in Eurostat meetings on this subject and is working closely on the possibility of developing new indicators. Initially, these will include statistics on building permits for commercial real estate, the start and completion of construction of commercial buildings, price indices for types of commercial buildings, rental price indices for types of buildings and the value of commercial real estate transactions. The possibility of providing reliable statistics for these indicators will be assessed in the coming years.

Medical index

The medical index was created to allow, among others, the indexation of premiums for supplementary health insurance policies, including hospitalisation insurance, on the basis of real changes in medical costs, in order to avoid major price shocks for consumers. Insurers can apply the medical index to premiums and/or exemptions and/or benefits. In addition to the medical index, the indexation of supplementary (non-professional) health insurance policies may also be based on the consumer price index for June of the previous calendar year.

The medical index is calculated each year by the Directorate-General Statistics – Statistics Belgium of the FPS Economy, but its current methodology had a number of shortcomings.

To remedy this, a working group has been set up. The working group is led by the FPS Economy and also includes representatives from Assuralia, Mutassur, the FSMA, the NBB and the OCM. There is currently an agreement in principle on an improved methodology, and an amendment to the Royal Decree on the medical index is currently being drafted. The necessary calculation programmes will then have to be developed.

6.3.2 Enterprise databases

Work on the **harmonisation of the business registers DBRIS (Statbel) and NAD (NBB)** will be continued. This will bring the methodologies of the partner institutions within the NAI much closer together.

New statistics on **local units** are currently being prepared. They will be available in 2024 in the form of experimental statistics in Statbel's Datalab.

7 Social statistics

7.1 Introduction

Statbel provides quality results on demography, the labour market, education and living conditions through household surveys and administrative databases.

The modernisation of social surveys is a major and particularly mobilising European project, with the aim of better meeting the information needs of the various stakeholders in society.

To this end, the new Regulation 2019/1700 establishing a common framework for European statistics relating to persons and households is applicable from 1 January 2021.

7.2 Recurring work

The **biannual Household Budget Survey (HBS)** will be organised in 2024. The results are expected in September 2025.

Each year, for households in the first wave, a special supplementary module is added to the **Labour Force Survey (LFS)**. The organisation of this module is coordinated by Eurostat. The results are delivered at the end of March of the following year. Some modules of the LFS survey are rotated at European level over several years. In 2023, the module focused on “pensions and labour market participation” and will be published in 2024. In 2024, the module will focus on “Young people on the labour market”. The preparation of the 2025 ad hoc module on “Reconciliation of work and family life” will also take place in 2024.

Each year, a special complementary module is added to the **European Survey on Income and Living Conditions (EU-SILC)**. The organisation of this module is coordinated by Eurostat. In 2024, the themes concerned will be “children” and “access to services”. The results are expected to be published in 2025.

The **annual survey on travel by the Belgian population** collects information on, among other things, the duration and reason for travel, the destination, the means of transport, the type of accommodation, the expenditure, the origin of the traveller. The population is also questioned about day visits. Each year, a specific module (the same one every three years) is added to the basic questionnaire. The 2024 module will ask questions on same-day visits abroad and in Belgium.

The **annual survey on ICT usage and Internet among households and individuals (ICT-Households)** measures internet access and use, computer skills and the development of e-commerce. Each year certain topics are further developed. In 2024, the biennial modules on the use of connected devices and green information technologies will once again be included.

The decennial **Census** provides results on population, housing, education, socioeconomic aspects. The current Census covers the year 2021.

7.3 Developments: ongoing and new projects

Modernisation of European social statistics

The Framework regulation integrating European social statistics (IESS) was published in 2019. It entered into force in 2021.

Many projects are in line with the implementation of this regulation, in particular those aiming at making data collections more flexible (modular) and promoting the use of databases and statistical methods to increase the speed of availability of results.

Household budget survey (HBS)

The reform of the HBS survey, according to the IESS regulation, should be effective in 2026. Preparatory work will start in 2024. The questionnaire, data collection tools and sampling plan will be evaluated and adapted.

In addition, work is underway, in consultation with the National Bank of Belgium, on a major overhaul of the **COICOP** (Classification of Individual Consumption According to Purpose) nomenclature.

Labour Force Survey (LFS)

In 2024, work will continue on calculating monthly results for unemployment, with a view to replacing the estimates currently produced by Eurostat.

Quarterly monitoring of living conditions (IALC)

In order to monitor the post-crisis social recovery as closely as possible, a quarterly data collection on social inclusion was launched in 2021. It has continued since then and will be repeated in 2024.

8 Demographic statistics

8.1 Introduction

The department of demographic statistics is responsible for the production and processing of all data and statistics relating to demography, in the broadest sense of the term. These statistics describe not only the structure of the population (sex, age, nationality, country of birth, households, ...), but also the demographic movements (births, deaths, migrations, marriages and divorces, moves).

The National Register of Natural Persons (**NRNP**) is the main source of data. Demographic data are coupled to various other internal and external databases, using the coded national register number and based on the appropriate legal procedures.

8.2 Recurring work

The **annual statistics on population structure and movement** provide results 6 months after the reference period. Ten other statistics are linked to this statistic, namely: **households, births, general mortality, life tables, loss and acquisition of nationalities, international migration and internal migration, origin and density of the population**. For mortality, figures are also produced on a weekly basis and provisional figures are published monthly for births and changes of nationality.

Other statistics produced from the NRNP are also published annually: **marriages, divorces, legal cohabitation and widowhood**.

The use of **civil registration forms** allows the production of statistics on **births and fertility, causes of death, feto-infant mortality and maternal mortality**.

8.3 Developments: ongoing and new projects

On the one hand, the department of demographic statistics will update some statistics. One project is the household typology, in which recent developments such as legal cohabitation and parentage will be integrated. Another project aims to create a new statistic in order to better map newly formed families. In addition, the data available on the Statbel website will be expanded. Existing data series, such as moves, will be better used.

Another area concerns the new European Statistics on Population (ESOP) regulation. This new regulation has not yet been adopted and is still being negotiated. It incorporates population and census statistics, so intensive collaboration will be required with the "Database - Citizens" department. In the short and medium term, ESOP will have a significant impact on the "Demographic statistics" department. In the short term, the department will participate in several Eurostat task forces in order to obtain a harmonised definition of the population and to draw up the implementing acts. In the medium term, once the regulation and accompanying implementing acts have been adopted, the department will have to adapt substantially to meet the requirements of the new regulation.

9 Statistics of the territory

9.1 Introduction

The department of territory statistics is responsible for a wide range of statistics on transport, environment and waste, road accidents, urbanisation, These statistics are produced from administrative data and surveys. For some statistics, Statbel explicitly collaborates with regional and other partners.

9.2 Recurring work

Statistics on goods and passenger **transport** are produced annually or quarterly: road freight transport, inland waterways transport, maritime transport and air transport.

Other statistics concern **traffic**: vehicle fleet and traffic accidents.

Finally, a number of statistics are produced on the different types of waste and on different **environmental** topics.

9.3 Developments: ongoing and new projects

The development of new products for **traffic accident** statistics, obtained by coupling the traffic accident database with other databases, is under study.

In addition, a number of new products regarding the **vehicle fleet** are being developed.

Possibilities for using data relating to the kilometre levy are being explored.

In the context of **multimodality**, work is underway to link the different modes of transport.

10 Communication & Dissemination

10.1 Introduction

The Communication & Dissemination department ensures that the figures produced by Statbel are communicated clearly and published in a user-friendly manner.

The website <http://statbel.fgov.be> is the main communication channel. The website is news-oriented and offers quick access to all statistics produced by Statbel, with the latest published figures highlighted. On the Statbel website, users will find news and press releases on recent publications and the most important results. It is also possible to access the data, both via downloadable files, in the be.STAT database and via open data.

Several tools are available on the Statbel website. From the be.STAT database, tailor-made tables can be created. Thanks to the rent calculator, tenants and landlords can easily (re)calculate the indexation of rents. In the 'Discover your municipality' tool, the data at the municipal level are presented in a clear and accessible way.

On a specific dashboard Statbel publishes various visualisations related to mortality. Under the theme 'Statbel DataLab', various statistical results are published in beta version.

Finally, primary school pupils can get an overview of their own municipality on the separate website 'Statbel Junior'. Under the banner "Statbel Academy", educational videos on Statbel statistics are published on YouTube.

Statbel strives to be transparent in its communications and to provide user-friendly services. In addition to the website, users are informed of new publications through press releases, newsletters and social media.

10.2 Recurring work

The Communication & Dissemination department carries out the following tasks:

- The **website**: daily dissemination of figures and preparation of tables and texts for online publication, in consultation with Statbel data producers.
- **be.STAT**: creation and updating of example tables with the main figures.
- **Open data portal**: provision of new data sets in open data formats to facilitate their re-use.
- **User support**: support for journalists and other users who ask questions about our statistics and figures.
- **Publications**: the compilation, final editing and layout of the annual paper publications, *Key Figures* on Belgium and *Key Figures* on Agriculture, as well as the electronic publication series 'Analyses'. Also the digitisation of the collection of paper publications and brochures.
- **Press releases**: coordination and final editing of press releases, to support important disseminations, but also communication of our statistics on the occasion of thematic world days, fairs and other important events.
- **Newsletter**: writing and distributing a weekly newsletter.
- **Social media**: communication of all releases on social media.

10.3 Developments: ongoing and new projects

The be.STAT application

New functionalities are added regularly, to make the application even more responsive to users' needs. The application will be migrated to a new Olap server: 'Mondrian'.

Statbel Junior

Since 2018, children from 8 to 12 years old can discover the world of statistics on our website: www.statbeljunior.be. Statbel Junior has been adapted to better meet the needs of teachers in the last years of primary education and the first years of secondary education. The new version of Statbel Junior is planned for early 2024.

Data visualisations

Data visualisations are the clearest and most effective way to communicate figures to the general public. Infographics and interactive visualisations are therefore increasingly used, both on the website and for various social media.

Development of open data

An ever increasing number of detailed data, nomenclatures, ... of Statbel are made available to the general public using different file formats (CSV, XLS, XML, ...), in order to facilitate their reuse by the user.

Organisation at the Belgian level of the European Statistics Competition

In collaboration with other IIS partners, Statbel will organise again the national phase of the 2024-2025 edition of the European Statistics Competition, which is aimed at secondary school students.

Relevant and topical statistics

There is a clear need for quickly available figures. This is why Statbel publishes provisional results quickly: weekly figures on mortality and bankruptcies, monthly figures on the labour market and on business start-ups. Mortality figures are centralised on an dashboard, where comparisons over time and with average mortality figures are possible. In addition, the information is published as much as possible in open data form, so that it can be used for various purposes.

In addition, first results on new possibilities of data exploitation are presented within the framework of the 'Statbel DataLab'. For example, the proximity of the population to public transport, motorways or schools. There are also results on car ownership among families or on catering staff. These figures appear on the Statbel website, in beta version.

The paper brochures are also available in digital format with interactive 'Key figures for agriculture' and a 'Key figures' brochure that can be navigated.

Events

Statbel keeps in touch with its stakeholders and users by organising themed events and taking part in conferences and fairs. In 2024, events will be organised to mark the 20th anniversary of the SILC survey, the Belgian Presidency of the Council of the European Union and the Census 2021. In addition, each year a workshop is organised for the press to popularise a number of concepts used for a particular statistical theme.

Census 2021

The results of the census 2021 will be published in 2024. All aspects of the census will be explained in detail, using various data visualisations, tables and explanatory texts.

11 Support to statistical production

11.1 Work programme

Statbel publishes an annual statistical programme, as do the other statistical authorities in the IIS, in order to allow coordination among the different programmes. The implementation of the work programme is regularly monitored.

11.2 Quality

Continuous efforts are made to update **management information** and to archive the documentation necessary for the production of statistics.

A **description** of **statistical sources** and **products** is provided in an existing '**metadata**' database, which is regularly updated. It covers all statistics, surveys and data sources.

Statbel has had **quality indicators for statistics** for some years, covering all dimensions (relevance, accuracy, timeliness, clarity, coherence).

Eurostat has launched an exercise to revise the **NACE** (Classification of Economic Activities), in order to make this classification more in line with the current economic situation. Statbel will follow the work closely in order to better prepare the transition to a new version of the classification. During the year 2024, the new national version of this classification (NACE-BEL) will be finalised.

11.3 Data warehouse & Data Support

Recurrent tasks

The Data warehouse & Data Support department provides **support to other Statbel teams**. Part of the team's resources will be allocated, as it is every year, to the implementation or adaptation of various workflows that enable the data collected to be transformed into data that can be easily used by the thematic services.

Article 15 of the law on public statistics provides for the possibility for certain research bodies to obtain from Statbel the communication of **pseudonymised study data** for scientific or statistical research purposes. The transmissions are governed by a formal procedure which is concluded by the signing of a confidentiality contract. The effort required to provide these data is growing, as the number and complexity of requests increase over time.

Developments

Development of **open data**: making aggregated data, classifications, ... available to the general public using various file formats (CSV, XLS, XML, ...), in order to facilitate the re-use of data published by Statbel.

Standardisation of register addresses in the data warehouse (link with the 'Best' project).

Geocoding of the addresses of the registers in the data warehouse (National Register of Natural Persons, Crossroads Bank of Enterprises, Business Register - DBRIS, ...).

In cooperation with the 'GIS' team (Geographic Information System): updating of the **new statistical breakdowns** in the data warehouse and compliance of the geographical data of the FPS Economy, SMEs, Self-employed and Energy with the '**Inspire**' directive.

12 Annex 1: List of statistics produced on a recurring basis by Statbel

Explanations

Coverage:

T: Belgium, **B:** Brussels-Capital Region, **V:** Flemish Region, **W:** Walloon Region, **F:** French Community, **N:** Flemish Community, **D:** German-speaking community, **Bf:** COCOF, **Bv:** VGC, **Bb:** COCOM/GGC

Spatial breakdown:

NUTS0: Belgium, **NUTS1:** regions, **NUTS2:** provinces, **NUTS3:** administrative districts, **LAU:** municipalities, **SS:** statistical sectors

Data collection type:

C: Census (exhaustive survey), **S:** Sample survey, **A:** Use of administrative register(s), **R:** Use of (private) non-administrative data base/file/register, **P:** Primary statistic, **D:** Direct information recording (e.g.: prices in retail trade), **B:** Use of big data, **Z:** other

Frequency:

52: weekly, **12:** monthly, **4:** quarterly, **2:** half-yearly, **1:** yearly, **0.5:** two-yearly, **0.33:** three-yearly, **0.25:** four-yearly, **0.2:** five-yearly, **0.1:** ten-yearly

Deadline:

T+xD = T+x days; **T+xW** = T+x weeks; **T+xM** = T+x months; **T+xY** = T+x years + **free text** in some cases

Development:

Ongoing or planned developments.

5503020	Stock of motor vehicles	Data on all vehicles registered in Belgium (personal vehicles, buses and coaches, trucks, tractors, special vehicles, motorcycles) on 1 August.	T	LAU	-	Gentlemen's agreement	A	1	Use of the data provided by the DIV	T+1M	N

Code	Name	Content	Coverage	Spatial breakdown	Belgian mandate	International mandate	Collection	Frequency	Sources	Deadline	Planned developments
9994122	Vehicles per household	Number of cars by household type, by region, province and municipality	T	SS	-	-	A	1	National register, vehicle fleet (DIV) and tax data (Belcotax)	T+8M	N
9994064	Registration of motor vehicles	Data on all motor vehicles registered in Belgium	T	LAU	-	-	A	1	Use of the data provided by the DIV	T+45D	N
5505010	Road traffic accidents with fatalities or casualties	Information on any accident on public roads resulting in personal injury	T	LAU	-	Dec 93/704/CE	A	1	Use of the data provided by the police and forms completed by the prosecutor's offices	T+6M	Y
1300070	Waste generation from agriculture, forestry and fishing	Waste generation and treatment	T	NUTS2	-	Reg 2150/2002	A,S	0.5	Paper survey	T+2Y	N
1300080	Waste generation from mining and quarrying, manufacturing and construction	Waste generation and treatment	T	NUTS2	-	Reg 2150/2002	A,S	0.5	Paper survey	T+2Y	N
9994019	Waste generated by services	Waste generation and treatment	T	NUTS2	-	Reg 2150/2002	A	0.5	Use of the data provided by the Regions	T+2Y	N
1300140	Waste generation by households	Waste generation and treatment	T	NUTS2	-	Reg 2150/2002	A	0.5	Use of the data provided by the Regions	T+2Y	N
1300260	Municipal waste	Waste generation and treatment	T	NUTS2	-	Reg 2150/2002	A	1	Use of the data provided by the Regions	T+1Y	N
9994113	Packaging waste	Packaging waste generation and recycling	T	NUTS0	-	Gentlemen's agreement	A	1	Interregional Packaging Commission (IRPC)	T+10M	N
1300160	Waste treatment, recycling and disposal	Quantity of waste and type of treatment	T	NUTS2	-	Reg 2150/2002	A	0.5	Use of the data provided by the Regions	T+2Y	N

Code	Name	Content	Coverage	Spatial breakdown	Belgian mandate	International mandate	Collection	Frequency	Sources	Deadline	Planned developments
1300520	Resources and water use	River water pollution and waste water treatment	T	NUTS0	-	Gentlemen's agreement	A,R	0.5	Use of various data sources	T+2Y	N
9900060	Land use	Breakdown of lands in built-up lands, non built-up lands and agricultural lands	T	LAU	-	Gentlemen's agreement	A	1	Use of various data sources	T+6M	N
1300740	Environmental sector activity	Core variables (business demography, bankruptcies, turnover, employment) of economic environmental sectors (recycling enterprises, business services)	T	NUTS0	-	Gentlemen's agreement	P,S	1	Calculated based on the Structural Business Survey	T+2Y	N
2008020	Environmental expenditure of enterprises	Expenditure for products/services related to preventing, reducing and eliminating pollution and/or any other degradation of the environment	T	NUTS0	-	Reg 691/2011 Reg 58/1997	P,S	1	Structural Business Survey	T+2Y	N

13 Annex 2: List of statistics produced in beta version by Statbel

Explanations

Spatial breakdown:

NUTS0: Belgium, **NUTS1**: regions, **NUTS2**: provinces, **NUTS3**: administrative districts, **LAU**: municipalities, **SS**: statistical sectors

Data collection type:

C: Census (exhaustive survey), **S**: Sample survey, **A**: Use of administrative register(s), **R**: Use of (private) non-administrative data base/file/register, **P**: Primary statistic, **D**: Direct information recording (e.g.: prices in retail trade), **B**: Use of big data, **Z**: other

Frequency:

52: weekly, **12**: monthly, **4**: quarterly, **2**: half-yearly, **1**: yearly, **0,5**: two-yearly, **0,33**: three-yearly, **0,25**: four-yearly, **0,2**: five-yearly, **0,1**: ten-yearly

Deadline:

T+xD = T+x days; **T+xW** = T+x weeks; **T+xM** = T+x months; **T+xY** = T+x years + **free text** in some cases

Name	Content	Spatial breakdown	Data collection type	Frequency	Sources	Deadline
Multinational groups in Belgium	Number, employment, activity sector, nationality	LAU	A	1	Crossroads Bank of Enterprises, personal income tax, VAT, Crossroads Bank for Social Security, NSSO, annual accounts of the National Bank of Belgium	-
Monthly figures on the labour market	Employed, unemployed and inactive persons, full-time, part-time, working hours, working from home	NUTS0	S	12	Survey: face to face 'CAPI' for the first interview and 'CAWI/CATI' for the following interviews	T+45D
Staff by activity sector	Socioeconomic characteristics of people working in the healthcare sector and in the accommodation and food services sector	NUTS2	A	-	National Register of Natural Persons, Crossroads Bank of Enterprises, data from the NISSE, data from the NSSO, data from the FPS Health (nursing staff)	-
Geographical breakdowns	Population living close to some specific points: hospital, senior care facility, school, train station, public transportation stop, motorway entrance, motorway, border	LAU	A	-	National Register of Natural Persons, FPS Health, Open Street Map, SNCB, De Lijn, TEC, STIB, Communities, Agentschap Zorg en Gezondheid Vlaanderen, AVIQ, Iriscare and Ostbelgien Live	-
Self-employed	Breakdown of the active self-employed in the CBSS with one or more CBE functions per gender, age group, Region and/or NACE section.	NUTS1	A	-	Crossroads Bank for Social Security, Crossroads Bank of Enterprises	-
Data from platforms in the residential tourism sector	Use of online platforms to rent private holiday accommodation.	NUTS3	R	-	Airbnb, Booking.com, TripAdvisor and Expedia	-
Accidents per type of vehicle	Technical characteristics of cars involved in accidents:	NUTS2	A	A	DIV, police, public prosecutor's offices	
Working through digital platforms	Frequency of work, working conditions, employee status, employee profile	NUTS0	S	-	Survey: face to face 'CAPI' for the first interview and 'CAWI/CATI' for the following interviews	-
